

UPRIGHT THREAD GUIDING

The Upright Thread Guide is an integral part of the elastic thread feeding system. It provides for adjustable height, overhead thread routing from the elastic thread feeding system to the production line. Multiple thread, ganged individual idler assemblies, with .375" thread spacing are mounted on a .25" diameter yoke and they are aligned with set collars. The yoke may have single or multiple idler shafts and is mounted to the upright with a universal positioning clamp.
